ATLAS ACQUIRES OPTION TO PURCHASE FLUORITE PROPERTY IN MEXICO  
-----

Denver, Colorado - Atlas Minerals Inc. (the "Company") announced today that through its wholly-owned Mexican subsidiary, Minerales Atlas S.A. de C.V., it has executed a six-month option to purchase the La Barra fluorite property. The property is comprised of three claims covering 300 hectares, or approximately 740 acres, and two existing underground mines that were reportedly last mined in early 1974. At the time the mine was idled, a reserve report prepared by the owner, Fluoresqueda, S.A., had identified for near-term mining nearly 195,000 tons of ore at an average grade of 46% CaF<sub>2</sub>. To date the Company has not independently verified the accuracy of this report, and, as a result, there can be no assurance that the reported quantity and quality of ore will be available for mining.

The property is located approximately 50 miles south of Douglas, Arizona, near Esqueda, Sonora, Mexico. Any new mining operations on the property would be within 12 miles of both an existing highway and railroad, with direct access by either means to U.S. markets via Douglas. During prior operations, raw ore was trucked to Esqueda where it was milled and concentrated for final sale and distribution. The mill foundations and rail siding remain and will be evaluated for possible acquisition during the option period.

From observations made by the Company, past mine development is estimated to have accessed less than 10% of the fluorite deposit, with much of the deposit remaining open along an apparent 3-kilometer strike length encompassed by the claims. Assays of material collected by the Company from both the underground mine workings and existing raw ore stockpiles have tentatively supported the earlier reported grades, with grades of these select samples running between 80 and 90% CaF<sub>2</sub>. Currently, the U.S. consumes approximately 600,000 tons of fluorite per annum. In 2001, all such consumption was from imports, primarily from China (66%), South Africa (23%) and Mexico (11%).

There are three grades of fluorite -- acid grade (containing more than 97% CaF<sub>2</sub>), ceramic grade (85% to 95% CaF<sub>2</sub>), and metallurgical grade (60% to 85%

## Edgar Filing: ATLAS MINERALS INC - Form 8-K

CaF<sub>2</sub>). Nearly 80% of U.S. consumption is for the production of hydrofluoric acid, primarily in Louisiana and Texas, and aluminium fluoride in Texas. The 2001 average U.S. Gulf import price for acid grade product was approximately \$150 per ton with metallurgical grade averaging \$115 per ton FOB millsite in Tampico, Mexico. Given the apparent high grade of the La Barra fluorite and its proximity and access to the U.S. Gulf Coast, the Company believes that it could have a competitive advantage in supplying product to the southern U.S. markets.

According to the Company's President, Gary E. Davis, "we are excited by the possibility of adding another industrial mineral to complement the Company's White Cliffs diatomite operation in Arizona. For the last year, we have been working closely with the Sonoran government in identifying prospective industrial minerals in the State and have developed a short list of those that we believe could have near-term potential. During the term of the initial six-month purchase option on La Barra, the Company will diligently evaluate the mining claims and existing underground mines, including any purported reserves available for near-term mining, as well as all aspects of possible future mine development, milling, product transportation, and end use markets." Atlas Minerals Inc. is principally engaged in the exploration, development and exploitation of mineral properties and is actively in the process of identifying new acquisition opportunities in the natural resource sector. Management's current efforts are being directed toward the identification of possible acquisition opportunities, primarily in the sectors of industrial minerals, base metals, and precious metals.
